

REA CARD

REA T3
THE NEW GENERATION

CUSTOMISED SOLUTIONS

REA Card produces innovative noncash payment systems and provides the suitable services.

The headquarters of the REA Group in Mühlthal near Darmstadt serve as laboratory for the development of complex applications both for stationary and mobile use of the proven technology. The Terminals are produced in the same house and distributed from there. Be it to a major bank, a provider of services or a retailer – REA Card implements the suitable and appropriate solution and offers all-around service. All as one-stop.

GOOD FOR BUSINESS

Safety, speed, flexibility – state-of-the-art technology: The fast pace technology evolution setting ever new standards in the field of noncash payment systems.

REA Card has developed a Terminal that can be implemented universally – that is already now prepared for the challenges of the future. By linking state-of-the-art technology standards with user friendliness and flexibility of the special equipment, REA T3 is setting new benchmarks in the field of noncash payment systems

REA T3 – TECHNOLOGY³

As transaction manager for the future the REA T3 can process customer data on three channels.

Equipped as standard with a hybrid card reader that makes it possible to read out the magnet strip or chip in only one process. Already at this point the REA T3 can also be upgraded for near field communications (NFC).

Thanks to the faster processor in the core of the REA T3, and not least its increased storage capacity, individual transactions are concluded even faster – and indeed for all important European card systems such as VISA, MASTERCARD and the Euro Alliance of Payment Schemes (EAPS).

WITH CERTAINTY WELL-FITTED

Upon introduction of the Single Euro Payments Area (SEPA) it will soon be possible to make noncash payments without further ado – and safely throughout Europe – without incurring additional charges.

The standards in this connection are already fulfilled ex works by the REA T3. Should further modifications become necessary in future, they can be carried out via a remote maintenance system. With the integrated »Kensington Lock«, the device can be protected against theft and manipulation.

ERGONOMICS IN THEIR THIRD GENERATION

The reliability, ergonomics and stability of the earlier product range has been retained by REA Card - also for the third generation of EC Terminals.

Thanks to the lighting in the keyboard of the REA T₃, the PIN can be entered even more conveniently and easily by the customer as the lighting of the display guaranties best readability, both for the customer and the employees. A »Drop-in« printing unit and a practical, safe cable conduit ensure even more convenience when operating in daily business.

FLEXIBILITY WHICH PAYS

Standard LAN connections ensure the linkup of the REA T3 to the local area networks. As option, the connection to a WLAN and a VPN tunnel is possible.

Thanks to a mobile option with GPRS or GSM the REA T3 can also be operated as a mobile device or via ISDN or can integrate an analogue telephone connection into the existing telephone system. In addition, a connection to the products of REA Mobile AG has been provided which has developed an innovative Client with its »rea-dy« to pay per mobile phone.
